## **ELECTRICITY WORKSHEET AS-Level Physics 9702**

MJ25/21/Q6

1 A nichrome wire X of length 45 cm and cross-sectional area  $4.7 \times 10^{-7}$  m<sup>2</sup> is connected into the circuit shown in Fig. 6.1.

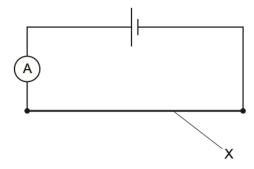

Fig. 6.1

The resistance of X is  $1.1\Omega$ . The cell has electromotive force (e.m.f.)  $1.3\,V$  and negligible internal resistance.

(a) (i) Calculate the current in X.

current = ......A [1]

(ii) The number density of charge carriers (electrons) in nichrome is  $8.5 \times 10^{28} \, \text{m}^{-3}$ .

Calculate the average drift speed of the charge carriers in X.

average drift speed = ..... ms<sup>-1</sup> [2]

(iii) Calculate the resistivity of the nichrome.

resistivity = .....  $\Omega$ m [3]

(b) Wire Y is identical to wire X. Wire Y is added to the circuit in parallel with wire X, as shown in Fig. 6.2.

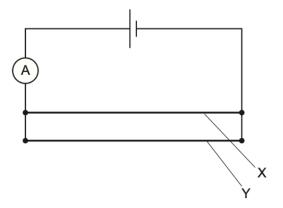

Fig. 6.2

State and explain the effect, if any, of this change on:

(i)	the reading on the ammeter
	[2]
(ii)	the average drift speed of the charge carriers in X.
	[1]
	[Total: 9]

## MJ25/24/Q5

2 (a) (i) State and explain the effect, if any, on the resistance of a filament wire in a lamp as the current in the wire decreases.

.....

(ii) On Fig. 5.1, sketch the *I*–*V* characteristic of a filament lamp.

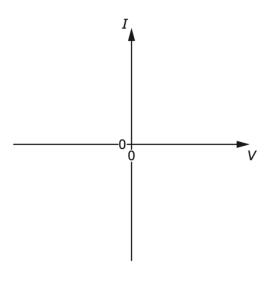

Fig. 5.1

[2]

**(b)** A battery of electromotive force (e.m.f.) *E* and negligible internal resistance is connected in parallel with two filament lamps A and B, as shown in Fig. 5.2.

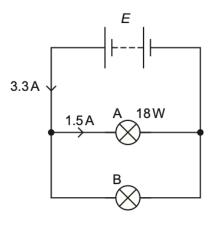

Fig. 5.2

The current in the battery is 3.3A and the current in lamp A is 1.5A. The power dissipated in lamp A is 18W.

3

(i)	Calculate the e.m.f. E of the battery.
	<i>E</i> = V [2]
(ii)	The filament wire of lamp B has a cross-sectional area of $1.4 \times 10^{-9}  \text{m}^2$ . The number of free (conduction) electrons per unit volume in the metal of the filament wire is $3.4 \times 10^{28}  \text{m}^{-3}$ .
	Calculate the average drift speed of the free electrons in the filament wire of lamp B.
	average drift speed = ms <sup>-1</sup> [3]
	average drift speed = ms 1 [3]

[Total: 8]

March25/22/Q6

A cylindrical copper wire P of length 0.24 m is shown in Fig. 6.1. 3

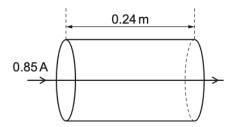

Fig. 6.1 (not to scale)

The current in the wire is 0.85A.

The resistance of the wire is  $3.3 \, \text{m}\Omega$ .

The **total** number of charge carriers *N* in the wire is  $2.6 \times 10^{22}$ .

The resistivity of copper is  $1.8 \times 10^{-8} \Omega \,\mathrm{m}$ .

(a) Calculate the potential difference between the two ends of the wire.

(b) (i) Show that the cross-sectional area of the wire is  $1.3 \times 10^{-6}$  m<sup>2</sup>.

[2]

(ii) Show that the number density of charge carriers in the wire is  $8.3 \times 10^{28} \, \text{m}^{-3}$ .

[1]

(iii) Calculate the average drift speed of the charge carriers (electrons) in the wire.

average drift speed = .....  $ms^{-1}$  [2]

(c) A different copper wire Q has the same volume as wire P, but non-uniform radius, as shown in Fig. 6.2.

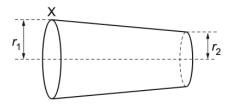

Fig. 6.2 (not to scale)

The radius  $r_1$  at end X of wire Q is the same as the radius of wire P. Radius  $r_2$  is less than  $r_1$ .

(i)	State and explain how the resistance of wire Q compares with the resistance of wire P.

(ii) On Fig. 6.3, sketch a graph of the variation of the average drift speed of the charge carriers with distance from end X of wire Q.

.....[4]

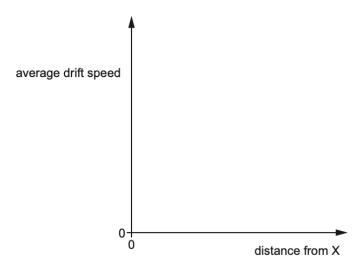

Fig. 6.3

[2]

[Total: 13]

4	(a)	Define electric potential difference (p.d.).	ON24/22/Q5		
			[1]		

**(b)** A power supply, three resistors and a component X are connected in the circuit shown in Fig. 5.1.

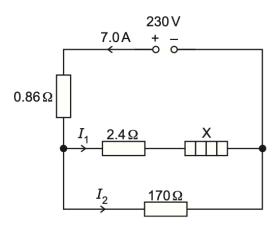

Fig. 5.1

The power supply has an electromotive force (e.m.f.) of 230 V and negligible internal resistance. The current in the power supply is 7.0 A.

(i) Identify component X.

.....[1]

(ii) Show that the p.d. across the resistor of resistance  $0.86\,\Omega$  is  $6.0\,V$ .

[1]

(iii) Determine the current  $I_1$ .

I<sub>1</sub> = ......A [2]

(iv)	Calculate the p.d. across component X.
	p.d. = V [2]
(v)	Calculate the power dissipated in component X.
	power = W [2]
(vi)	The purpose of the circuit is to provide power to component X.
	Determine the percentage efficiency of the circuit.
	efficiency =% [2]
(vii)	The resistor of resistance $170\Omega$ is removed, leaving an open circuit in the lower branch of the circuit. There is no change to the resistance of component X.
	State whether the current in the power supply increases, decreases or remains the same.
	[1]
	[Total: 12]

5	(a)	Def	ine resistance. ON24/23/Q6
			[1]
	(b)		ylindrical metal wire of length 2.4 m and cross-sectional area $8.0 \times 10^{-6}$ m <sup>2</sup> has a resistance $0.33\Omega$ . There is a current in the wire of 4.7 A.
		(i)	Determine the resistivity of the metal from which the wire is made.
			resistivity = $\Omega$ m [2]
		(ii)	Calculate the charge that passes through the wire in a time of 5.0 minutes.
			charge = C [2]
		(iii)	The free electrons (charge carriers) in the wire have an average drift speed of $0.16\mathrm{mms^{-1}}$ .
			Determine the number density of charge carriers in the metal.

number density = .....  $m^{-3}$  [2]

- (c) The wire in (b) may be considered to be a fixed resistor. It is connected in series with a thermistor to a battery that has negligible internal resistance.
  - (i) Use circuit symbols to complete Fig. 6.1 to show the circuit diagram of this arrangement.

Fig. 6.1

(ii)	Explain, without calculation, how the power dissipated in the wire changes as the temperature of the thermistor is increased.
	[2]

[Total: 10]

## MJ24/22/Q5

**(b)** A battery of electromotive force (e.m.f.) 9.0 V and negligible internal resistance is connected in series with a variable resistor X and a thermistor Y as shown in Fig. 5.1.

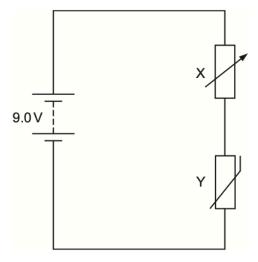

Fig. 5.1

Fig. 5.2 shows the relationship between temperature and resistance for the thermistor.

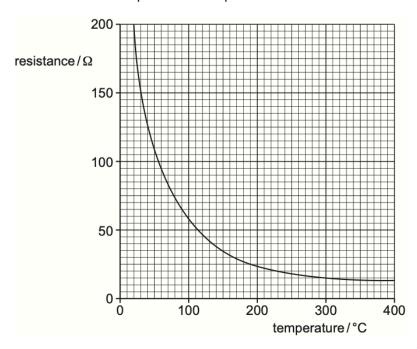

Fig. 5.2

(i) The current in the circuit is  $1.1 \times 10^{-2}$  A. The potential difference across Y is 4.0 V. Calculate the resistance of X.

resistance = ..... 
$$\Omega$$
 [2]

(ii) The temperature of Y is changed to 190 °C. The resistance of X remains unchanged.
Determine the new potential difference across Y.

(iii) The resistance of X is increased. The temperature of Y remains at 190 °C.

By reference to the current in the circuit, state and explain the effect of this change, if any, on the potential difference across Y.

A battery is connected in a circuit with a light-dependent resistor (LDR), two fixed resistors and a voltmeter, as shown in Fig. 6.1.

ON23/21/Q6

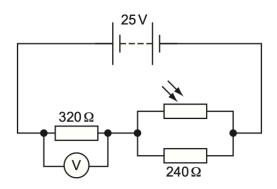

Fig. 6.1

The battery has an electromotive force (e.m.f.) of 25 V and negligible internal resistance. The resistors have resistances of  $320\,\Omega$  and  $240\,\Omega$ .

- (a) The voltmeter displays a reading of 16 V.
  - (i) Show that the current in the battery is 0.050A.

[1]

(ii) Calculate the resistance of the LDR.

resistance = .....  $\Omega$  [3]

(iii) Determine the ratio

 $\frac{\text{power dissipated in the LDR}}{\text{power dissipated in the 240}\,\Omega\,\text{resistor}}.$ 

	ra	atio =	[2]
(b)	The intensity of the light incident on the LDR inc	creases.	
	State and explain what happens to the voltmeter	er reading.	
			[3]
		[Total:	9]

ON23/22/Q6

(a) A metal wire has a resistance per unit length of  $0.92 \Omega \, \text{m}^{-1}$ . The wire has a uniform cross-sectional area of  $5.3 \times 10^{-7} \, \text{m}^2$ .

Calculate the resistivity of the metal of the wire.

resistivity = .....  $\Omega$  m [2]

**(b)** A battery of electromotive force (e.m.f.) *E* and negligible internal resistance is connected in series with a fixed resistor and a light-dependent resistor (LDR), as shown in Fig. 6.1.

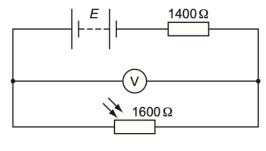

Fig. 6.1

8

The resistance of the fixed resistor is  $1400\,\Omega$ . The intensity of the light illuminating the LDR causes it to have a resistance of  $1600\,\Omega$ . A voltmeter connected across the LDR reads  $6.4\,V$ .

cau	uses it to have a resistar	ce of $1600\Omega$ . A voltmeter connected across the LDR reads $6.4V$ .
(i)	Show that the current	n the LDR is $4.0 \times 10^{-3}$ A.
(ii)	Calculate the number	[1] of free electrons passing through the LDR in a time of 3.2 minutes.
(iii)	n Calculate the e.m.f. E.	umber of free electrons =[2]
(iv)	Determine the ratio	$E = \dots \qquad \qquad$

ratio = ......[2]

Cyrus Ishaq

(c) The environmental conditions change causing a decrease in the resistance of the LDR in (b). The temperature of the environment does not change.

State whether there is a decrease, increase or no change to:

(i) the intensity of the light illuminating the LDR

г	4	'n
 L	. I	J

(ii) the current in the battery

[4]
. !!!

(iii) the reading of the voltmeter.

 [1]

12

A student sets up a circuit with a battery, an ammeter, a heater and a light-dependent resistor (LDR) all in series.

The battery has negligible internal resistance.

A voltmeter is connected across (in parallel with) the heater.

(a) On Fig. 5.1, complete the circuit diagram of this arrangement.

Fig. 5.1

[3]

(b) The heater is a wire made of metal of resistivity  $1.1 \times 10^{-6} \,\Omega$  m. The wire has length 2.0 m and cross-sectional area  $3.8 \times 10^{-7} \, \text{m}^2$ .

The reading on the voltmeter is 4.8 V.

Calculate:

(i) the resistance of the heater

resistance = ......  $\Omega$  [2]

(ii) the reading on the ammeter.

reading on ammeter = ...... A [1]

(c) The heater is replaced by a new wire. The new wire is made of the same metal as the wire in (b) and has the same length but a larger diameter.

The resistance of the LDR remains constant.

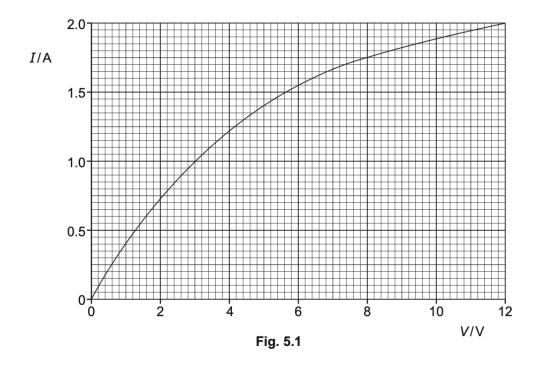

(i)	State and explain whether the new wire has a resistance that is greater than, less than or the same as that of the wire in <b>(b)</b> .				
	[2]				

(ii)	State and explain whether the new reading on the voltmeter is greater than, less equal to 4.8 V.

(b) The variation of current I with potential difference V for a filament lamp is shown in Fig. 5.1.

Cyrus Ishaq ISL RR, ISL PA, BCP Gulberg, TCS Ravi, Kaizen, Roots IVY +923008471504 https://cyrus-physics.com

The resistance of the filament lamp increases with potential difference.

(i) State how Fig. 5.1 shows this.

(ii)

	[1]
Explain why the resistance varies in this way.	

(c) Fig. 5.2 shows a circuit with a battery of electromotive force (e.m.f.) 12.0 V connected to a linear potentiometer AB and two identical filament lamps P and Q.

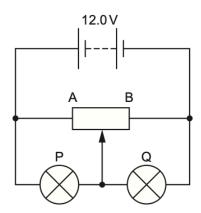

Fig. 5.2

The battery has negligible internal resistance and the lamps each have the same I-V characteristic shown in Fig. 5.1.

When the slider of the potentiometer is at its midpoint, as shown in Fig. 5.2, the current I in the battery is 1.78A.

Determine:

(i) the current in lamp P

current = ...... A [1]

(ii) the total power dissipated in lamps P and Q

total power = ...... W [2]

(iii) the resistance of the potentiometer between its ends A and B.

	resistance = $\Omega$ [2]
(d)	The slider of the potentiometer in (c) is moved to end A.
	State and explain the effect on the brightness of lamps P and Q.

MJ22/21/Q6

A battery is connected to two resistors X and Y, as shown in Fig. 6.1. 15

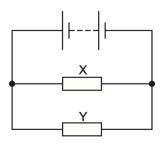

Fig. 6.1

The resistance of resistor X is greater than the resistance of resistor Y.

(i) State and explain which resistor dissipates more power.

			[0]
	 	 	[3]

(ii) The two resistors are made of wires that have the same length. Both wires are made from metal of the same resistivity.

State and explain which resistor is made of wire with the larger cross-sectional area.

[2]

(c) A battery of electromotive force (e.m.f.) 9.0 V and negligible internal resistance is connected in series with a light-dependent resistor (LDR) and a fixed resistor of resistance  $1800\Omega$ , as shown in Fig. 6.2.

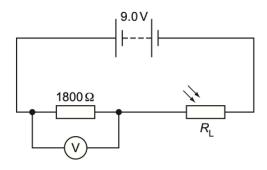

Fig. 6.2

A voltmeter is connected across the fixed resistor. The reading on the voltmeter is 5.4 V.

(i) Calculate the current in the circuit.

(ii) Calculate the resistance  $R_1$  of the LDR.

$$R_{L}$$
 = ......  $\Omega$  [2]

(iii) The intensity of the light illuminating the LDR increases.

By reference to the current in the circuit, state and explain the change, if any, to the voltmeter reading.

.....[2]

16 (a) (i) On Fig. 6.1, sketch the I-V characteristic of a filament lamp.

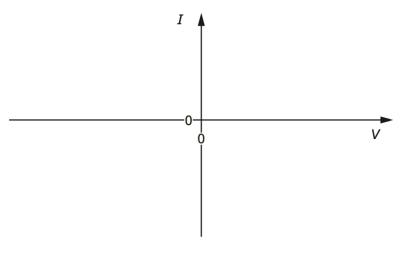

Fig. 6.1

[2]

(ii)	Explain the shape of the line in (a)(i).		
	[3]		

(b) A conducting wire has length 5.8 m and cross-sectional area  $3.4 \times 10^{-8} \, \text{m}^2$ . The resistivity of the metal of the wire is  $5.6 \times 10^{-8} \, \Omega \, \text{m}$ .

Calculate the resistance of the wire.

resistance = .....  $\Omega$  [2]

(c) A resistor of resistance *R* is placed in a circuit with a cell of negligible internal resistance, two switches S<sub>1</sub> and S<sub>2</sub>, a second resistor of resistance 2*R* and three ammeters X, Y and Z. The circuit is shown in Fig. 6.2.

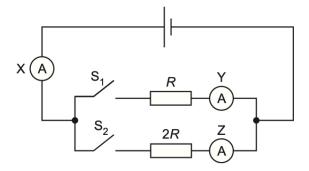

Fig. 6.2

The reading on X is 1.0A when  $\mathbf{S}_1$  is open and  $\mathbf{S}_2$  is closed.

Complete Table 6.1.

Table 6.1

[4]

[Total: 11]

The ends of a metal resistance wire are connected to a battery of electromotive force (e.m.f.) 8.0 V and negligible internal resistance, as shown in Fig. 6.1.

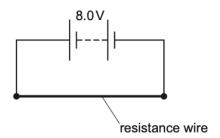

Fig. 6.1

The power dissipated by the resistance wire is 36 W.

- (a) Calculate:
  - (i) the current in the resistance wire

(ii) the number of free electrons that pass through the resistance wire in a time of 50 s

(iii) the resistance of the wire.

resistance = ......  $\Omega$  [2]

(b)	The metal of the resistance wire in the circuit has a resistivity of 1.4 $\times$ 10 <sup>-6</sup> $\Omega$ m. The cross-sectional area of the wire is 0.25 mm <sup>2</sup> .
	Determine the length of the wire.
	length = m [2]
(c)	The circuit shown in Fig. 6.1 is modified by replacing the original resistance wire with a second resistance wire. The second wire has a greater diameter than the original wire. There are no other differences between the second wire and the original wire.
	By reference to resistance, state and explain whether the power dissipated by the second wire is more than, less than or the same as the power dissipated by the original wire.

(d) The circuit shown in Fig. 6.1 is modified by connecting a second battery, of e.m.f. 8.0 V and negligible internal resistance, in parallel with the original battery and the original resistance wire, as shown in Fig. 6.2.

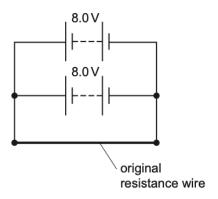

Fig. 6.2

By reference to the current in the resistance wire, state and explain whether the addition of the second battery causes the power in the original resistance wire to decrease, increase or stay the same.

[Total: 12]

- (a) Metal wire is used to connect a power supply to a lamp. The wire has a total resistance of 18  $3.4\,\Omega$  and the metal has a resistivity of  $2.6\times10^{-8}\,\Omega$ m. The total length of the wire is 59 m.
  - (i) Show that the wire has a cross-sectional area of  $4.5 \times 10^{-7}$  m<sup>2</sup>.

[2]

(ii) The potential difference across the total length of wire is 1.8 V.

Calculate the current in the wire.

current = ...... A [1]

(iii) The number density of the free electrons in the wire is  $6.1 \times 10^{28} \,\mathrm{m}^{-3}$ .

Calculate the average drift speed of the free electrons in the wire.

average drift speed = ...... m s<sup>-1</sup> [2]

(b) A different wire carries a current. This wire has a part that is thinner than the rest of the wire, as shown in Fig. 5.1.

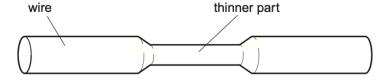

Fig. 5.1

(i)	State and explain qualitatively how the average drift speed of the free electrons in the thinner part compares with that in the rest of the wire.
	[2]
(ii)	State and explain whether the power dissipated in the thinner part is the same, less or more than the power dissipated in an equal length of the rest of the wire.

- (c) Three resistors have resistances of  $180 \Omega$ ,  $90 \Omega$  and  $30 \Omega$ .
  - (i) Sketch a diagram showing how **two** of these three resistors may be connected together to give a combined resistance of  $60\,\Omega$  between the terminals shown. Ensure you label the values of the resistances in your diagram.

[1]

(ii) A potential divider circuit is produced by connecting the three resistors to a battery of electromotive force (e.m.f.) 12V and negligible internal resistance. The potential divider circuit provides an output potential difference V<sub>OUT</sub> of 8.0 V. Fig. 5.2 shows the circuit diagram.

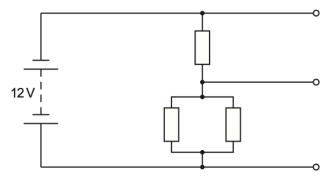

Fig. 5.2

On Fig. 5.2, label the resistances of all three resistors and the potential difference  $V_{\rm OUT}$ .
